The sequence represents primer c816F, used to sequence the human RAD51 gene. The nucleic acid is useful in diagnosing genetic predisposition or susceptibility to breast cancer in an individual using the following steps: (1) detecting a mutation in the RAD51 gene in a human subject, comprising analysing a sample from the subject to detect the mutation; (2) assessing the risk of developing breast cancer, comprising: (a) analysing a sample from the subject for the presence of BRCA1 and/or BRCA2 mutations; and (b) if (a) is positive, analysing the sample for a mutation in the RAD51 gene, where the presence of the RAD51 mutation indicates an increased risk in developing breast cancer in the subject compared to a subject having at least one of the BRCA mutations and a wild-type RAD51 gene. Primers derived from the sequence can be used in a kit for detecting a mutation in the RAD51 gene of a subject, which is associated with a predisposition to breast cancer, comprising at least 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gob-5 gene (coding sequence shown in AN446101) or its human counterpart, the CLCA1 gene (coding sequence shown in AN446102). The invention also relates to an antibody specific for the Gob-5 protein, medical and diagnostic compositions containing the antisense nucleotide or the antibody, and methods and kits for screening for compounds which inhibit the protein. Gob-5 and CLCA1 are proteins expressed by goblet cells. The antisense oligonucleotides and antibody are therefore useful for the treatment and prevention of bronchial asthma and chronic obstructive pulmonary disease. Sequences AN446135-AN446136 represent primers used in an exemplification of the invention to sequence human CLCA1 cDNA (AN446124)
                                                                                                                                                                                                                                                                                                                                                                                                           Wang
                                                                                                                                                                                                                                                                                                              New nucleic acids comprising a mutant of the RAD51 gene, useful for diagnosing genetic predisposition or susceptibility to breast cance
                                                                                                                                                                                                                                                                                                                                                                        WPI; 2001-235217/24.

                                                                                                              The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. The present sequence is an oligonucleotide described in the exemplification of the invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acid primers derived from the RAD51 gene sequence
                                                                                                                                                                                                                                                                               Predicting the potential of an oligonucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of
                                                                                                                                                                                                                                                                                                                                WPI; 2001-424456/45
                                                                                                                                                                                                                                                                                                                                                                                                    10-FEB-1998;

The present invention relates to human and murine G protein-coupled CC receptor (GPCR) protein, IGPCR17 (ANMA8353 and ANMA8354). The coding CC sequence for IGPCR17 is useful in gene therapy for prevention, CC amelioration or treatment of diseases characterised by aberrant CC expression or activity of IGPCR17, where the disease is a psychiatric or CC central nervous system (CNS) disorder associated with signal processing in CNS such as learning and memory disorders, movement dysfunctions, CC tics, tremor, Tourette's syndrome, Parkinson's disease, Huntington's CC disease, dyskinesias, dystonia, pain and spasms. In addition, IGPCR17 and its coding sequence are useful in diagnosis, prevention, amelioration or treatment of diseases associated with signal processing in CNS, CC consessive compulsive disorder (CDD), multiple sclerosis, Alheimer's CC disease/dementia, anorexia, kidney diseases such as renal failure, CC disease/dementia, anorexia, kidney diseases such as renal failure, CC disease/dementia, anorexia, kidney diseases such as irritable bowel syndrome CC (IBS), diarrhoea, mortility disorders and conditions of delayed gastric comptying, osteoporosis, infections such as bacterial, fungal, protozoal cand viral infections, asthma, allergy, arthritis, sepsis and CC gynecological disorders. This sequence was used along with the primer of CC (IBS) for tissue-specific expression analysis of IGCR17 in an example of from the treatment of the presention manascale.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            immunosuppressive; gene therapy; psychiatric disorder; central nervous system disorder; movement dysfunction; schizophrenia; multiple sclerosis; Alzheimer's disease; kidney disease; obesity; gastrointestinal disorder; osteoporosis; infection;

                                                                                                                                                                 are fat regulated. (I) or the polymucleotide encoding it (II) are useful for diagnosing the presence of or a predisposition for a disorder convolving fatty acid regulated genes in a subject. A composition containing (I) or (II) is useful for treating a disorder involving fatty acid (PUFA) disorder is selected from a polymusaturated fatty acid (PUFA) disorder, eczema, cardiovascular convolving fatty disorders (coronary artery disease, cerebrovascular disease or peripheral vascular consequence, including pancreatitis, estema, pancreatitis, estematorial solving fat research agent and diabetic complications. (I) or (II) is useful as research agent and materials for complications. (I) or (II) is useful as research agent and materials for constructing nucleotide probes and primers, expressed to isolate polymorphism, for detecting changes in the level of expression of (II), and as a diagnostic tool. This sequence represents a correct converse used to isolate polymorphism fat remains and disease.

                                                                                                                      (such as blood, pancreas or tongue) for sequence variations of the SAC1 gene. A sequence variation of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polynucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes
                                                                                                                                                                                                                                                                            The invention relates to an isolated polypeptide, comprising a variant form of mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated polypeptide comprising variant form of mouse or human SACI polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; mouse; SAC1; carbohydrate; sweetener; ethanol; alcoholism; ss; obesity; diabetes; transgenic embryo; body tissue; body fluid; pancreas; blood; torgue; PCR primer; anorectic; antidiabetic; gene therapy; protein replacement therapy.
                                                                                                                                                                                                                               embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human

                                                                                                                                                              The invention relates to an isolated polypeptide, comprising a variant CC form of mouse or human SAC1 polypeptide. The variant form is associated CC with altered preference for carbohydrates, other sweeteners or ethanol. CC The polypeptide and its associated DNA sequence can be produced by CC recombinant techniques and is useful for preventing obesity, diabetes or clobolism associated with SAC1 expression. The sequences are useful in CC creening for drugs and sweeteners. Recombinant cell lines and transgenic cembryos may be used in screening for and identifying agents that induce CC or repress function of SAC1. Predisposition to diabetes, obesity or CC clobolism can be ascertained by testing any fluid or tissue of a human CC (such as blood, pancreas or tongue) for sequence variations of the SAC1 locus may indicate a CC diagnostic mark. The polynucleotide can be detected in a biological CC sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and CC which is then detected. The sequences represent cDNA encoding human and CC mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes

                                                                                                                                             The invention relates to an isolated polypeptide, comprising a variant CC form of mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by crecombinant techniques and is useful for preventing obesity, diabetes or calcoholism associated with SAC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or calcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 (gene. A sequence variation of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymucleotide can be detected in a biological cample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and complex sequences sacc1 polypeptides and PCR primers specific for the SCA1 genes

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated polypeptide, comprising a variant CC form of mouse or human SAC1 polypeptide. The variant form is associated CC with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by CC recombinant techniques and is useful for preventing obesity, diabetes or CC alcoholism associated with SAC1 expression. The sequences are useful in Screening for drugs and sweeteners. Recombinant cell lines and transgenic CC embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or CC alcoholism can be ascertained by testing any fluid or tissue of a human CC (such as blood, pancreas or tongue) for sequence variations of the SAC1 (gene, A sequence variation of the SAC1 locus may indicate a CC predisposition to diabetes, obesity and/or alcoholism and may provide a CC diagnostic mark. The polynucleotide can be detected in a biological complex which is then detected. The sequences represent cDNA encoding human and CC mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes
                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense compound (I) 8-30 nucleobases in length targeted to a nucleic acid molecule encoding lysophospholipase I (II), where (I) specifically hybridises with and inhibits the expression of (II). (I) is useful for inhibiting the expression of (II) in cells or tissues, and for treating a human having a disease or condition associated with Lysophospholipase I e.g. inflammation, hyperlipidaemia, and cardiovascular disorders such as atherosclerosis and myocardial schaemia. (I) is useful as research reagent and disgnostics. (I) is also useful for distinguishing functions of various members of a biological pathway. (I) is useful in antisense gene therapy. ABK37028-ABK37191 represent lysophospholipase I coding sequences, antisense oligonucleotides are modified such that bases 1-5 and 16-20 are 2 methoxyethy (2'-MOE) nucleotides all bases have phosphorothioate interest.
                                                 Non-insulin dependent diagnosis; prognosis; insulin; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antisense compound useful for treating inflammation, hyperlipidemia, and cardiovascular disorders such as athen myocardial ischemia, inhibits Lysophospholipase I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; mouse; antiinflammatory; antiarteriosclerotic; vasot antilipaemic; cardiant; lysophospholipase I; inflammation; hyperlipidaemia; cardiovascular disorder; atherosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides methods for determining the risk of. CC development of non-insulin dependent diabetes mellitus (NIDDM or type II CC diabetes) in a subject. It results from the discovery that homozygotes of the HphI locus of the insulin gene along with body fat measurement serve conditions with HphI(+/-) or (-/-) genotypes are significantly more continued in the phI locus of the insulin HphI locus. The marker in linkage disequilibrium with the insulin HphI locus. The marker is especially -4217 PstI, -2221 MspI, -2231 MspI, +1428 PokI, +1000 AluI and +32000 ApaI. In an example, new polymorphisms were screened to determine whether they altered a controls, and a subset of polymorphisms was amplified using the primer INS57 to amplify the -2221 MspI site. PCR products were digested with MspI and gel electrophoresed to determine game yield using the primer INS57 to amplify the -2221 MspI site. PCR products were conducts of digestion were 108 and 78 bp for +/+, and 186 bp for -/- genotypes, where (+) indicates the restriction invention provides methods for diagnosting a subtype of NIDDM, for cestimating the frequency of a haplotype for a set of genetic markers in a population suffering from juvenile obesity (claimed), and methods to facilitate therapy and maintenance of NIDDM patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś

```
CC CACNADED gene which encodes human calcium channel alphadelta-2 subunit CC protein) comprising a fully defined alpha2delta splice isoform 1, 2 or 3 cc include are: (1) a method of producing a calcium channel proteins. Also cc include are: (1) a method of producing a calcium channel protein which cinvolves introducing a recombinant expression vector comprising the cc calculated host cell under conditions such that the host cell expresses the calcium channel protein, into a cc cultured host cell under conditions such that the host cell expresses the calcium channel protein, into a cc cultured host cell under conditions such that the host cell expresses the calcium one expression vector comprising one or more mucleic acid sequences encoding the splice variants. CACNAPD2 nucleic acid is useful for proteins, comprising carrying out the method of (1), but with one or more than one expression vector comprising one or more nucleic acid sequences composing the splice variants. CACNAPD2 nucleic acid is useful for polypeptide is useful for treating patients with Lambert-Eaton myasthenic compounds useful for treating other disease associated with abnormal calcium channel protein activity (e.g. epilepsy, migraine, episodic attaxia, cancer, stroke, brain trauma, Alzheimer's disease, multilinfarct dementia, carca-koff's disease, amyotrophic lateral sclerosis, convulsions, convulsions, the cardiovascular system, myocardial infarction, congestive heart calcium; muscular dystrophy and hypertension) CACNAPD2 nucleic acid is sequence encoding at least a portion of calcium channel protein, in detection, identification and isolation of alpha2delta sequences common in cancer (e.g. lung cancer and breast cancer) and served common in cancer (e.g. lung cancer and breast carcer) and served common in cancer (e.g. hupg cancer and breast carcer) and served common in cancer (e.g. hupg cancer and breast cancer) and content for the present is an SCCP (single strand change soluting a bruan calcium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel purified nucleic acid sequence encoding human calcium channel alpha2delta subunit protein, useful for detecting, preventing and treating cancer, stroke, brain trauma, Huntington's disease, myocar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 7; Col 46; 77pp;

                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated peptide (I) consisting of an CC amino acid sequence selected from: (a) the amino acid sequence of a coarint of the oestrogen receptor alpha (ESR-alpha) protein in AAG68251; (CC or (b) a fragment comprising at least 10 contiguous amino acids of the protein in AAG68251. (I) has cytostatic, osteopathic, cardiant and coarticle (I) is useful for identifying an agent that binds to (I), by contacting (I) with an agent and assaying the contacted mixture to cetermine whether a complex is formed with the agent bound to the peptide. A polymucleotide (II), encoding (I), is useful in the coverage and disorders mediated/modulated by an oestrogen receptor (ER). (II) is also useful in gene therapy for treating cancer, osteoporosis and cardiovascular coareases. The human ESR-alpha gene is located on chromosome 6. ABA99973 coarent perseent PCR primers, and ABA90011 to ABA90037 represent coarmine for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene, which are used in an cardiovascular for the human ESR-alpha gene.
                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of diagnosing atherosclerosis or predicting the susceptibility of a subject to atherosclerosis, comprising determining the presence or absence of a single nucleotide polymorphism (SNP) in codon 379 of a lipoprotein-associated phospholipase A2 (Lp-PLA2) encoding polymucleotide, where the codon comprising the SNP encodes an amino acid other than valine. The method is useful for predicting the likelihood of developing atherosclerosis, predicting and responding to the progression of the atherosclerotic condition and drug treatment, or predicting disease outcome in a subject. The method is also useful in the selection of patient groups for conducting clinical trials concerning therapeutic compounds with potential for use in the treatment of atherosclerosis. The present sequence is human lipoprotein-associated phospholipase A2 gene amplifying primer used to detect polymorphism in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;

The nucleic acid probe control with a fluorochrome when hybridised with target nucleic acid, the decrease in the fluorescence is measured. I method can be used for measuring a target nucleic acid
                                                                                                                                                                                                                                                                                                                                              ABA97650 standard;

The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The

CC in length targeted to a nucleic acid molecule encoding Inhibitor of DNA C binding-1, where (I) specifically hybridises with and inhibits the CC expression of Inhibitor of DNA binding-1. Antisense inhibition of human CC Inhibitor of DNA binding-1 expression by chimeric phosphorothioate CC expression of DNA binding-1 expression by chimeric phosphorothioate CC oligonucleotides having 2' methoxyethyl (2'-MOE) wings and a deoxy gap CC was tested. A series of oligonucleotides were designed to target CC different regions of the human Inhibitor of DNA binding-1 RNA. The compounds were analysed for their effect on human Inhibitor of DNA binding-1 RNA. The CC monomial of the human Inhibitor of DNA binding-1 RNA. The compounds were sult showed that the oligonucleotides showed at least 25% CC inhibition of human Inhibitor of DNA binding-1 in cells or tissues by contacting the expression of Inhibitor of DNA binding-1 in cells or tissues by contacting the cells or tissues with (I). (I) is also useful CC for treating a human having a disease or condition associated with CC Inhibitor of DNA binding-1 by administering a therapeutically or CC prophylactically effective amount of (I), where the disease or condition is a hyperproliferative disorder, immune disorder, muscular disorder, CC diagnostics, therapeutics, prophylaxis (e.g., to prevent or delay condition sequence represents a human Inhibitor of DNA binding-1, antisense CC oligonucleotide used in the method of the invention binding-1, antisense CC oligonucleotide used in the method of the invention.

for

oligonucleotide used in the method of the invention

CC gene, which inhibit its expression. The antisense oligonucleotides were consigned to target different regions of the human and/or mouse C/EBP CC alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels by quantitative real-time PCR. The C/EBP family of proteins are a family CC of transcription factors which regulate the expression of a wide range of CC genes that control normal tissue development, cellular function, cellular CC proliferation and functional differentiation. C/EBP beta (also known as CC C/EBP2, LAP, TCP5, CRP2, NFIL6, IL6DBP, NF-M, ACP/EBP beta (also known as CC C/EBP2, LAP, TCP5, CRP2, NFIL6, IL6DBP, NF-M, ACP/EBP beta is continued to be involved in carbohydrate metabolism, immunity, the Thick thought to be involved in carbohydrate metabolism, immunity, the Thick expressed in the liver, lung, spleen, kidney, brain, and testis, with the highest expression found in the lung. It is also expressed at a higher CC level in malignant ovarian tissue compared with normal ovarian tissue, CC and its expression in pancreas is upregulated in response to chronically celevated levels of glucose, indicating that it is involved in the confidence of the invention are useful for diagnosis, prevention and treatment of conditions associated with C/EBP beta expression, such as cancer (particularly ovarian cancer), tumour formation, diabetes (particularly ovarian), rumour formation Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha) H diabetes), infection, or inflammation

CC oligonuclectide probes (II) will hybridise with little mismatch, where (II) have melting temperatures within a narrow range. The method is useful (II) have melting temperatures within a narrow range. The method is useful (II) detections diseases caused by bacterial infectious agents (II) will hybridise and harmow range. The method is useful (II) fectious agents e.g. Cryptococcus meoformans, Candida albicans and (II) septeillus funiquitus, viruses e.g. T-cell lymphocytotrophils cirus, (II) selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus (II) medinesis. The method is also useful for detecting genetic diseases such (II) detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the (II) gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (Using e.g. a scanning (II) september of the support at the particular sites and infrared microscope) the support at the probe sets occurred and correlating (Using a computer) identified ligation to a gressance or absence of the target nucleotide sequences. ABI92074 to of the present invention.

Also included are an expression vector comprising the nucleic acid and a host cell transformed with the vector. The gene for CDC14A is located on human chromosome 1p21. The nucleic acid and protein are useful to diagnose and treat human cancers (e.g. breast cancer, prostate cancer) and tumours (e.g. lymph node metastasis, malignant mesothelioma) which have a mutation in the CDC14A gene, by gene therapy, protein replacement therapy or protein mimetics. They can also be used to screen for drugs to treat sequence is a splice donor or splice acceptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid encoding mutated form of human dual-specificity phosphatase CDC14A polypeptide, useful to diagnose and treat cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primers ABL56504-07 were used to amplify fragments of the human GJB6 gene. The GJB6 gene encodes connexin-30 (Cx-30). A G to A mutation at position 31 and/or a C to T mutation at position 263 causes Clouston syndrome (hydrotic ectodermal dysplasia). Nucleic acids encoding Cx-30, antisense oligonucleotides and vectors containing them, are used to treat Clouston syndrome and other forms of alopecia with a genetic component. They are also used to reduce growth of hair and/or promote hair loss. They may also be used for (cosmetic) treatment and/or prevention of disorders of the hair. Transgenic animals/cells that contain Cx-30 are used to screen for agents that are potentially useful for treating some forms of alopecia. Primers derived from GJB6 gene are useful in

The invention relates to novel human oestrogen receptor variant peptides, and the polynucleotides encoding them. The peptides of the invention have cytostatic, osteopathic and cardiant activity. The peptides of the

mediate or modulate

Peptide of estrogen receptor alpha genes variant or its in identifying modulators for treating disorders e.g. a

                                                                                                                        The present invention relates to a method of determining a nucleic acid sequence, involving incubating with a probe, adding at least one phosphorothioate nucleotide in presence of an enzyme that synthesises a complementary sequence on the 3'-end of the probe, and adding a second enzyme that degrades the phosphorothioate-free complement. The method can be used to determine very short (up to 10 base pair) sequences, especially for characterisation of single-nucleotide polymorphisms. The present sequence is a probe for the human MTHFR gene which was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      as a susceptibility to cancer, osteoporosis, cardiovascular disorder, etc., and hence are useful in the treatment of the disorders. The sequences shown in ABQ87720-ABQ87746 represent PCR primers used in the invention to sequence individual exons of the human oestrogen receptor
                                                                                       Sequence
                                                                                                                                                                                                                                                                     Determining nucleic acid sequence, useful for characterizing single-
nucleotide polymorphisms, by incubating with probe in presence of
phosphorothioate nucleotide and exonuclease.

                                                                                                                         밁
                                                                                                                                                                             ঠ
                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method of determining the susceptibility or resistance of an animal to porcine reproductive and CC respiratory syndrome virus (PRRSV). This involves assaying for CD 151 in C a sample of cellular material of known origin from the animal. In CC addition, coding sequences of CD 151 are described, and anti-viral CC compounds designated anti-RNA entry proteins (anti-REPs). The method is C useful for determining susceptibility and resistance to PRRSV in an CC animal. This is particularly useful for improving swine breeding or for CC screening different pig breeding lines. The method is also useful for CC certains on-simian recombinant cell lines for propagating the virus, CC developing non-simian recombinant cell lines for inducing immunity CC against PRRSV, and for diagnosing PRRSV infection in a swine. The present CC sequence is a PCR primer used to isolate the porcine CD 151 coding CC the printed specification, but was obtained in electronic format directly CC from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of Junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylattic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine CC lung surfactant in a subject stissue, or treating bronchoconstriction, lung surfactant in a subject, or treating bronchoconstriction, lung surfactant in a subject or tissue, or treating bronchoconstriction, lung allargies, or a respiratory disease or condition.

CC Note: The sequence data for this patent is not represented in the printed cat firm who, intronchance of contraction, but was obtained in electronic format directly from WIPO cat firm, who, intronchance of the composition of the printed cat for this patent is not represented in the printed cat firm who intronchance is contented.

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 3' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammatory steroid in a subject, for reducing levels of adenosine CC receptor, producing bronchodilation, increasing levels of adenosine CC lung surfactant in a subject stissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO or after wino int/mih/shad not semences.

                                                                                                                                                                                                                                                             Хü
                                                                                                             밁
                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                          The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composicion may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject stissue, or treating bronchoconstriction, lung sulfactant, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO Cast fry wino, which leads for resources.

The invention relates to a novel pharmaceutical composition, which has a cfirst active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, cc 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of cc junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc antiinflammatory, antiallergic, antisthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also cf enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of biquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, cl ung inflammation, lung allergies, or a respiratory disease or condition. Cc lung inflammation, but was obtained in electronic format directly from WIPO at the payment directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO cr

                                                                                                                                                                                                                                           Χü
                                                                                                     밁
                                                                                                                                                                                                                                                                                   junctions of genes encoding a polypeptide associated with lung and/or cast airway dysfunction and a second active agent comprising an antialianmatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of condition.

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC of or reducing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels CC antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine cof lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed CC specification, but was obtained in electronic format directly from WIPO CC at fig. vipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                             S
                                                                      ABZ97793
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cy junctions of genes encoding a polypeptide associated with lung and/or compasal airway dysfunction and a second active agent comprising an compastinifiammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a composition may have a composition antisense gene therapy. The composition is useful for treating or compressive, antistratory, lung or malignant disease or condition, also composition as a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine composition, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine composition in a subject stissue, or treating bronchoconstriction, composition inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed general composition, but was obtained in electronic format directly from WIPO as the print of the

                                                                                                                                      맑
                                                                                                                                                                                 ફ
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the coin intiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding regions, or regions within 2-10 nucleotides of cy and 3' intron-exon junctions, or regions within 2-10 nucleotides of cy inctions of genes encoding a polypeptide associated with lung and/or cc nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention chas antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or greventing a respiratory, lung or malignant disease or condition, also cf or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of buiquinone or lung surfactant in a subject stissue, or treating bronchocomstriction, and supject stissue, or treating bronchocomstriction, continuous surfactant in a subject stissue, or treating bronchocomstriction, increasing levels of the printed specification, but was obtained in electronic format directly from WIPO at frem wino intransity, while is adenosed in the printed of the printed of the printed and the printed of the p

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of gunctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmattic, hypotensive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC constanting a respiratory, lung or malignant disease or condition, also CC for reducing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels CC antiinflammatory steroid in a subject, for reducing evels of adenosine coffice of the sequence of this patent is not represented in the printed CC Note: The sequence data for this patent is not represented in the printed CC specification, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-OCT-2003

                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                    first active agent comprising an oligonuclectide antisense to the chintiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of comprising a polypeptide associated with lung and/or comprising an extra property steroid and ubiquinone. A composition of the invention comprising an extiinflammatory steroid and ubiquinone. A composition of the invention comprising an extra property, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a compressive, and cytostatic or therapeutic respiratory effect of an activity for prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing or depleting levels of adenosine coffice of compressive producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine of lung surfactant in a subject s tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed appectification, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a composition codon, coding region, 5 or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 6' or regions within 2-10 nucleotides of 6' junctions of genes encoding a polypeptide associated with lung and/or 6' or comparison of the invention 6' or assal airway dysfunction and a second active agent comprising an 6' or assal airway dysfunction and a second active agent comprising an 7' or composition at a subject, antiasthmatic, hypotensive, 7' or immunosuppressive, and cytostatic activity. The composition may have a 7' or enthancing the prophylactic or the composition is useful for treating or 7' or preventing a respiratory, 1' ung or malignant disease or condition, also 6' or enhancing the prophylactic or therapeutic respiratory effect of an 7' or reducing the prophylactic or therapeutic respiratory effect of an 7' or reducing sensitivity to adenosine, reducing levels of adenosine 7' or reducing bronchodilation, increasing levels of ubiquinone or 8' or 1' or 1'
                                                                                                                                                                                    닭

                                                                                                                                                                                                                                      밁
                                                                                                                                 S
                                                                                                                                                                                                                                                        CC The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5 or 3 end genomic flanking regions, CC 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC Note: The sequence data for this patent is not represented in the printed Specification, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC compositing a respiratory, lung or malignant disease or condition, also CC containing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of an containinflammatory steroid in a subject, for reducing adenosine coft or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine coft on surfactant in a subject's tissue, or treating bronchoconstriction. CC lung surfactant in a subject's tissue, or respiratory disease or condition. CC where the sequence data for this patent is not represented in the printed conscription, but was obtained in electronic format directly from WIPO CC at fig. vipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                            The invention relates to a novel pharmaceutical composition, which has a confirmation for the segment comprising an oligonucleotide antisense to the confirmation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or antiinflammatory steroid and ubiquinone. A composition of the invention cathinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a composition is useful for treating or greventing a respiratory, lung or malignant disease or condition, also composition for the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine code subject, and subject at tissue, or treating bronchoconstriction, lung surfactant in a subject at tissue, or treating bronchoconstriction. CC lung inflammation, lung allergies, or a respiratory disease or condition. Subjective trissue, or treating bronchoconstriction, but was obtained in electronic format directly from WIPO care for which in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                      The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory, steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of reducing sensitivity to adenosine, reducing levels of adenosine ceptor, producing bronchodilation, increasing levels of buquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC set from which has obtained in electronic format directly from WIPO at the was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflanmatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antiense gene therapy. The composition is useful for treating or
                                                                                                                                                                                                                                                                                                       preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of continuing sensitivity to adenosine, reducing evels of adenosine CC for reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine of lung surfactant in a subject's tissue, or treating bronchocoonstriction. CC lung surfactant in a subject's tissue, or respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed conscription of the printed specification, but was obtained in electronic format directly from WIPO can first the printed specification in the printed specification in the printed specification.

                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition, which has a confirmation codon, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding and a coding regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or coding and a second active agent comprising an continflammatory steroid and ubiquinone. A composition of the invention and a second active agent comprising an communication of the invention coding and cytostatic activity. The composition may have a communosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also confiniflammatory steroid in a subject, for reducing or depleting levels of antisinflammatory steroid in a subject, for reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or composition and antising antisort's risasse or readers of ubiquinone or composition and composition are composition.

The invention relates to a novel compound that is 8-50 nucleotides in CC length that is targeted to a nucleic acid molecule encoding apolipoprotein B (ApoB), and specifically hybridises with and inhibits CC specifically hybridises with at least an 8-nucleotide portion of an active site on a nucleic acid molecule encoding ApoB; or which CC specifically hybridises with at least an 8-nucleotide portion of an CC anterior has antilipaemic, antiarteriosclerotic, antidiabetic, and cardiovascular activity. The compound may have a use in CC gene therapy. The antisense oligonucleotide is useful for treating an CC condition involving abnormal lipid metabolism, a condition involving abnormal lipid metabolism, a condition involving CC abnormal cholesterol metabolic condition (e.g. hyperlipidaemia, diabetes (geocifically Type 2 diabetes), obesity, atherosclerosis or cardiovascular disease). The new compound or the antisense CC (specifically VLDL, HDL or LDL) or serum triglyceride levels (particularly in a human. The antisense compound or the ansociated for particularly in a human. The antisense compound or the associated with ApoB, or the onset of a disease or condition of the exemplification of the animal or the ansecoiated with ApoB, or the onset of an increase in glucose levels in the animal or the annimal or the animal o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel compound of 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding a short heterodimer partner-1. The novel compound specifically hybridizes with a nucleic acid molecule encoding the short heterodimer partner-1, and inhibits the expression of the nucleic acid molecule. The compound, and a composition comprising it are useful for treating a disease or condition associated with the short heterodimer partner-1, particularly a condition involving abnormal lipid or cholesterol metabolism such as atherosclerosis or a cardiovascular disease. They are also useful in research and diagnostics for modulating the expression of short heterodimer partner-1. They can also be useful prophylactically in preventing or delaying infection, inflammation or tumour formation. This polynucleotide sequence represents a mouse antisense oligo relating to the heterodimer partner-1 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antiarteriosclerotic; cardiant; vasotropic; antiinfective; cytostatic; antiinflammatory; inhibitor; antisense gene therapy; atherosclerosis; short heterodime; partner-1; abnormal; lipid; cholesterol metabolism; cardiovascular disease; infection; inflammation; tumour formation; mouse;

The presence of a paternal insulin VNTR class I allele indicates that the subject has an approximately 2-fold increase in risk of developing obesity compared with a subject carrying a paternal insulin VNTR class II allele. Methods are provided to facilitate rational therapy and maintenance of individuals predisposed to obesity. The insulin VNTR allele may be genotyped by determining the identity of a nucleotide at an insulin-related genetic marker that is in linkage disequilibrium with the insulin HphI locus. This includes any marker that is a surrogate for the VNTR in the insulin gene. The -2221 MspI marker is an example of a genetic marker associated with the insulin gene, and can be detected by PCR using primers INS56 (present sequence) and INS57 (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining the risk of developing obesity for treating or reducing the risk of developing obesity by determining a paternal insulin variable number of tandem repeats allele in the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              31-JUL-2001; 2001US-0309235P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a new compound, 8-50 nucleobases in length targeted to a nucleic acid molecule encoding human apolipoprotein(a), specifically hybridizes with and inhibits the expression of human apolipoprotein(a). The antisense compounds are useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis or cardiovascular disease. Sequences ACC47284-318 represent specific examples of chimeric antisense phosphorothicate oligonucleotides having 2'-MOE wings and a deoxy gap targeting human onligonucleotides having 2'-MOE wings and a deoxy gap targeting human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                     Mus musculus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound, useful for preparing a composition abnormal lipid or cholesterol metabolism, atherosclerosis cardiovascular disease.

The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting mouse IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI:, 2003-039602/03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                              30-MAR-2001;

The compound is useful for preparing a composition for treating (e.g. by gene therapy) hyperproliferative disorder, cancer e.g., breast, colon, bone, brain, ovary, cervix, endometrium, stomach or kidney cancer, or tumour metastasis. This sequence represents an anitsense oligonucleotide used to modulate expression of urokinase plasminogen
                                                                                                                    The invention relates to a method of diagnosing juvenile polyposis (JP) or colorectal carcinoma. The method involves obtaining a sample from a subject and determining the loss or alteration of a functional BMPRIA gene in cells of the sample. The method is useful in diagnosing or treating JP or colorectal carcinoma. The invention is also useful in ge therapy. The present sequence is BMPRIA exon specific PCR primer, used illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                               Diagnosing or treating juvenile polyposis or colorectal carcinoma, comprises obtaining a tissue or fluid sample from a subject and determining the loss or alteration of a functional BMPRIA gene in

                                                                                                                                                                                                                                    The invention relates to a method of diagnosing juvenile polyposis (JP) or colorectal carcinoma. The method involves obtaining a sample from a subject and determining the loss or alteration of a functional BMPRIA gene in cells of the sample. The method is useful in diagnosing or treating JP or colorectal carcinoma. The invention is also useful in gene therapy. The present sequence is a PCR primer used in BMPRIA exon mutation analysis. This primer is used to illustrate the method of the

Human VEGFR-1 chimeric phosphorothioate

oligonucleotide

SEQ

ID NO:55

```
The present invention describes a compound (C) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding vascular endothelial growth actor receptor-1 (VEGFR-1), where the compound inhibits the expression of VEGFR-1 and specifically hybridises with the nucleic acid encoding VEGFR-1 are viewed an annucleobase portion of an active site on the nucleic acid molecule encoding VEGFR-1. Also described: (1) a composition of acid molecule encoding VEGFR-1. Also described: (1) a composition of vEGFR-1 in cells or tissues by contacting the cells or tissues with (C) that the expression of VEGFR-1 is inhibited; and (3) treating an animal having a disease or condition associated with VEGFR-1 by administering (C) to the animal so that the expression of VEGFR-1 is inhibited; and can be used in antisense cytostatic and antisinflammatory activities, and can be used in antisense gene therapy. The antisense compounds are useful for modulating the expression of VEGFR-1 and for treating diseases or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 such as hyperprises or conditions associated with the expression of VEGFR-1 
                                                                                                                                                            Query Match

The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a human VEGFR-2 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor 1; VEGF receptor; VEGFR; inhibitor; cytostatic; anti-rheumatic; anti-archiritic; anti-anglogenic; anti-inflammatory; anti-sense gene therapy; hyperproliferative disorder; cancer; rheumatoid arthritis; anglogenesis; infection; inflammation; tumour formation; phosphorothioate; 2'-O-methoxyethyl; 2'-MOE; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotide targeted to a nucleic acid encoding vascular endothelial growth factor receptor-1, useful for diagnosing treating cancer, rheumatoid arthritis, or diseases or conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    modified_base

                                                                                                                                                                                  The present invention relates to the sequencing of genomic DNA encoding human oestrogen receptor alpha (ESR1) protein. The gene encoding human ESR1 is located on chromosome 6. The invention provides the genomic structure of the ESR1 gene and novel single nucleotide polymorphisms (SNPB)/haplotypes in the genes. The polymorphisms/haplotypes can lead to a variety of disorders (such as cancer, osteoporosis, and cardiovascular disorders) that are mediated by a variant oestrogen receptor. The invention provides methods of detecting ESR1 polymorphisms/haplotypes in a sample, methods of determining a risk of having or developing a disorder mediated by a variant oestrogen receptor and methods for screening compounds useful for treating such disorders. ABX33756-ABX33782 represent sequencing primers for the human ESR1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20-OCT-1999;

                                                                                                                                The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, wiskort-Aldrich syndrome, retinitis plymentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase 1 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides for modulating PCTAIRE protein kinase gene expression, particularly useful for treating hyperproliferative neurological disorders for example, mental retardation, or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3p21.3; primer;
```

The invention relates to a substantially purified amino acid sequence comprising at least a portion of human calcium channel alpha2delta subunit splice isoform 1, splice isoform 2 sequence or splice isoform 3, or their variants, and their encoding nucleic acids (or their compound for modulating calcium channel activity, an antibody which binds to the calcium channel or its variants and producing a transgenic non-thuman animal (where the animal expresses a reduced level of calcium channel alpha 2delta subunit relative to a corresponding wild-type animal. The calcium channel proteins are useful for generating an animal (where the animal expresses a reduced level of calcium channel alpha 2delta subunit relative to a corresponding wild-type animal. The calcium channel proteins are useful for generating an comit of their portions or their portions). The transgenic animal (preferably a rodent e.g. mouse) is useful for identifying a therapeutic compound for treating a transgenic animal calcium channel proteins or their portions. The archival carcinoma or non-small calcium channel, breast cancer, naspoharyngeal cancer, cervical cancer, cancer, a neurological disease, especially epilepsy, a transgenic animal allowers, is a neurological disease, bultinfarct dementia, transpendent cancer, a neurological disease, wultinfarct dementia, Example New substantially pure human calcium channel alpha2delta subunit splice isoform 1, 2 and 3 sequence useful in preventing, treating and diagnosing cancer, neurological disorders and cardiovascular disease. 7; 25; English.

This invention relates to novel chimeric antisense oligonucleotides that specifically hybridise to and inhibit the expression of the nucleotide binding oligonucleotide domain 1, NODI protein. NODI, also known as CARDA (caspase associated recruitment domain 4) is a domain that is involved in the elimination of cells via programmed cell death and in the host defence against pathogens, i.e. it works to regulate apportosis. Apoptosis is a naturally occurring process, however, if it becomes overstimulated it can lead to cell loss and neurodegenerative conditions including Alzheimer's, Parkinson's, amyotrophic lateral sclerosis (ALS), retinitis pigmentosa and blood cell disorders. Conversely, insufficient apoptosis can contribute to the development of cancer, autoimmune disorders and viral infections. The present invention describes antisense oligonucleotides that can modulate NODI expression (and variants to thereof), such that these compounds, via gene therapy, can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       arrhythmia, angina pectoris, hypoxic damage to the cardiovascular system, ischaemic damage to the cardiovascular system, myocardial infarction, and congestive heart failure, or Lambert-Eaton myasthenic syndrome. The proteins and nucleic acids are useful in the diagnosis, prevention and treatment of the above mentioned diseases. The human gene for the calcium channel is located on chromosome 3p21.3. The present sequence is an SSCP (single strand conformation polymorphism) primer used to detect polymorphisms in the calcium channel alpha2delta subunit gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compound, comprising a sequence targeted to a nucleic acid encoding nucleotide-binding oligomerization domain 1 (NOD1), useful for preparing a composition for treating hyperproliferative disease, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 15; Page 75; 138pp; English.
